A 9 years old girl presented with first attack of hematemesis and melena. Upper gastrointestinal endoscopy revealed active blood spurting from Dieulafoy’s lesion ~ 5 cm away from the cardia. Endoscopic banding was performed, followed by mucosal tattooing using methylene blue, with excellent hemostasis.

Figure 1: Active blood spurting from Dieulafoy’s lesion.

Figure 2: Dieulafoy’s lesion after banding.

Figure 3: Mucosal tattooing using methylene blue, with excellent hemostasis.
