

Fig (2): The Receiver Operator Characteristic (ROC) curve of portal vein blood flow volume (PVBF) for detection of fibrosis degree in liver biopsy. (A) For $\leq F2$, AUC was 0.77 (95% CI=0.622-0.917). At a cut-off point ≥ 0.443 L/min, portal vein blood flow volume had sensitivity of 76.2% and specificity of 66.7% in detecting hepatic fibrosis in liver biopsy is F2 or less. (B) For F3, it was not an accurate method (AUC = 0.201, 95% CI=0.61-0.340).
